# Side effects

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

# The None value

The special value `None` represents nothingness in Python.

Any function that doesn't explicitly return a value will return `None`:

```
def square_it(x):  
    x * x
```

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

# The None value

The special value `None` represents nothingness in Python.

Any function that doesn't explicitly return a value will return `None`:

```
def square_it(x):  
    x * x
```

Assignment Project Exam Help

<https://powcoder.com>

When a function returns `None`, the console shows no output at all: Add WeChat powcoder

```
square_it(4)
```

# The None value

The special value `None` represents nothingness in Python.

Any function that doesn't explicitly return a value will return `None`:

```
def square_it(x):  
    x * x
```

Assignment Project Exam Help

<https://powcoder.com>

When a function returns `None`, the console shows no output at all: Add WeChat powcoder

```
square_it(4)
```

Attempting to treat the `None` like a number will result in an error:

```
sixteen = square_it(4)  
sum = sixteen + 4      # TypeError!
```

# Side effects

A **side effect** is when something happens as a result of calling a function besides just returning a value.

The most common side effect is logging to the console, via the built-in `print()` function.

```
print(-2)
```

<https://powcoder.com>

A similar side effect is writing to a file:

```
f = open('songs.txt', 'w')  
f.write("Dancing On My Own, Robyn")  
f.close()
```

Add WeChat powcoder

# Side effects vs. Return values

```
def square_num1(number):  
    return pow(number, 2)
```

```
def square_num2(number):  
    print(number * 2)
```

Assignment Project Exam Help

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

# More function features

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

# Default arguments

In the function signature, a parameter can specify a **default value**. If that argument isn't passed in, the default value is used instead.

**Assignment Project Exam Help**  
`def calculate_dog_age(human_years, multiplier = 7):  
 return human_years * multiplier`

<https://powcoder.com>

These two lines of code have the same result:

**Add WeChat powcoder**  
`calculate_dog_age(3)  
calculate_dog_age(3, 7)`

Default arguments can be overridden two ways:

`calculate_dog_age(3, 6)  
calculate_dog_age(3, multiplier=6)`

# Multiple return values

A function can specify multiple return values, separated by commas.

```
def divide_exact(n, d):  
    quotient = n // d  
    remainder = n % d  
    return quotient, remainder
```

Any code that calls that function must also "unpack it" using commas:

```
q, r = divide_exact(618, 10)
```

# Doctests

Doctests check the input/output of functions.

```
def divide_exact(n, d):
```

```
    """
```

```
>>> q, r = divide_exact(2021, 10)
```

```
>>> q
```

```
202
```

```
>>> r
```

```
1
```

```
    """
```

```
    quotient = n // d
```

```
    remainder = n % d
```

# Boolean expressions

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

# Booleans

A **Boolean value** is either `True` or `False` and is used frequently in computer programs.

Google Maps uses a boolean to decide whether to avoid highways in driving directions:

```
avoid_highways = True
```

Twitter uses a boolean to remember where the user allows personalized ads:

```
personalized_ads = False
```

# Boolean expressions

An expression can evaluate to a Boolean. Most Boolean expressions use either comparison or logical operators.

## Assignment Project Exam Help

An expression with a comparison operator:

```
passed_class = grade > 65
```

<https://powcoder.com>

## Add WeChat powcoder

An expression with a logical operator:

```
wear_jacket = is_raining or is_windy
```

# Comparison operators

Operator	Meaning	True expressions
==	Equality	<code>32 == 32</code>
!=	Inequality	<code>32 != 32</code>
>	Greater than	<code>60 &gt; 32</code>
>=	Greater than or equal	<code>60 &gt;= 32</code> , <code>32 &gt;= 32</code>
<	Less than	<code>20 &lt; 32</code>
<=	Less than or equal	<code>20 &lt; 32</code> , <code>32 &lt;= 32</code>

⚠ Common mistake: Do not confuse `=` (the assignment operator) with `==` (the equality operator).

# Logical operators

Operator	True expressions	Meaning
and	<code>4 &gt; 0 and -2 &lt; 0</code>	Evaluates to <code>True</code> if both conditions are true. If one is <code>False</code> evaluates to <code>False</code> .
or	<code>4 &gt; 0 or -2 &gt; 0</code>	Evaluates to <code>True</code> if either condition is true. Evaluates to <code>False</code> only if both are false.
not	<code>not (5 == 0)</code>	Evaluates to <code>True</code> if condition is false; evaluates to <code>False</code> if condition is true.

Add WeChat powcoder

# Statements

A **statement** is executed by the interpreter to perform an action.

So far we've seen a few...

Assignment Project Exam Help

**Statement type**

**Example**

Assignment statement

```
name = 'sosuke'  
greeting = 'ahoy, ' + name
```

Def statement

```
def greet(name):  
    return 'ahoy, ' + name
```

Return statement

```
return 'ahoy, ' + name
```

<https://powcoder.com>

Add WeChat powcoder

# Compound statements

A **compound statement** contains groups of other statements.

```
<header>:  
    <statement>  
    <statement>  
    ...  
  
<separating header>:  
    <statement>  
    <statement>  
    ...
```

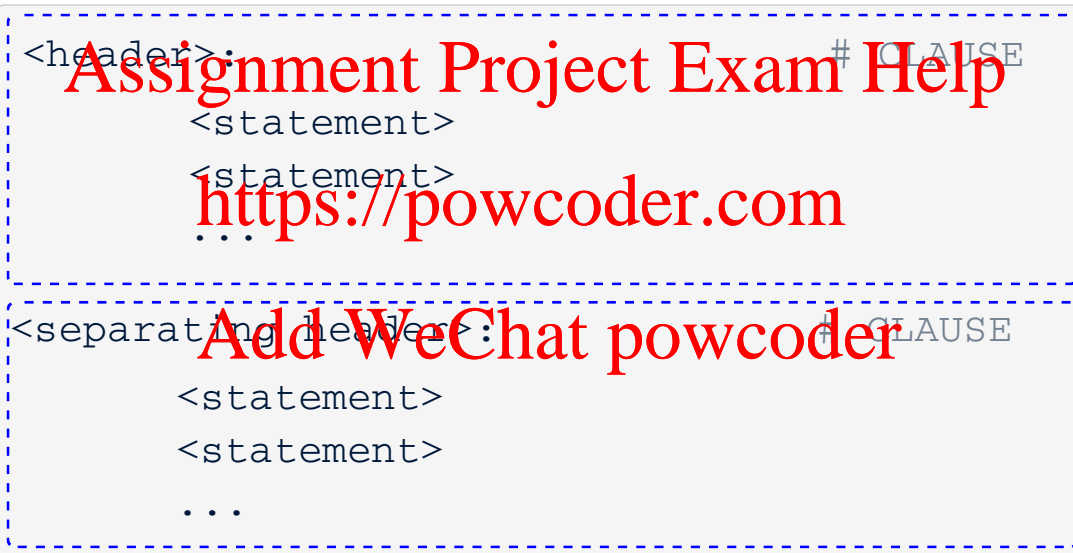

Assignment Project Exam Help

<https://powcoder.com>

# Compound statements

A **compound statement** contains groups of other statements.

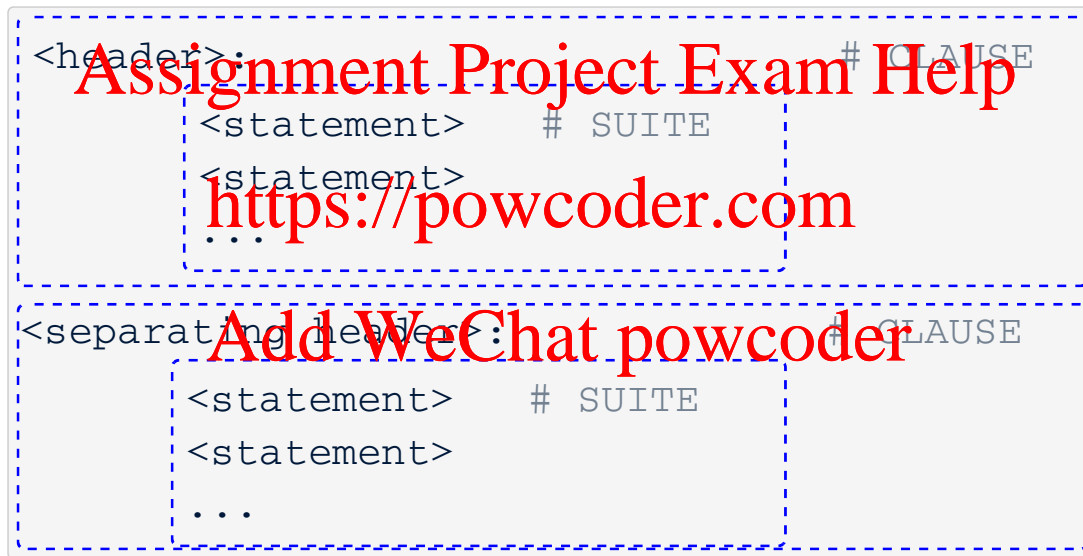

# Compound statements

A **compound statement** contains groups of other statements.

# Compound statements

A **compound statement** contains groups of other statements.

The first header determines a statement's type, and the header of each clause controls the suite that follows.

# Execution of suites

A **suite** is a sequence of statements.

```
<header>:
```

```
    <statement>
```

```
    <statement>
```

```
    ...
```

```
<separating header>:
```

```
    <statement>
```

```
    <statement>
```

```
    ...
```

Assignment Project Exam Help

<https://powcoder.com>

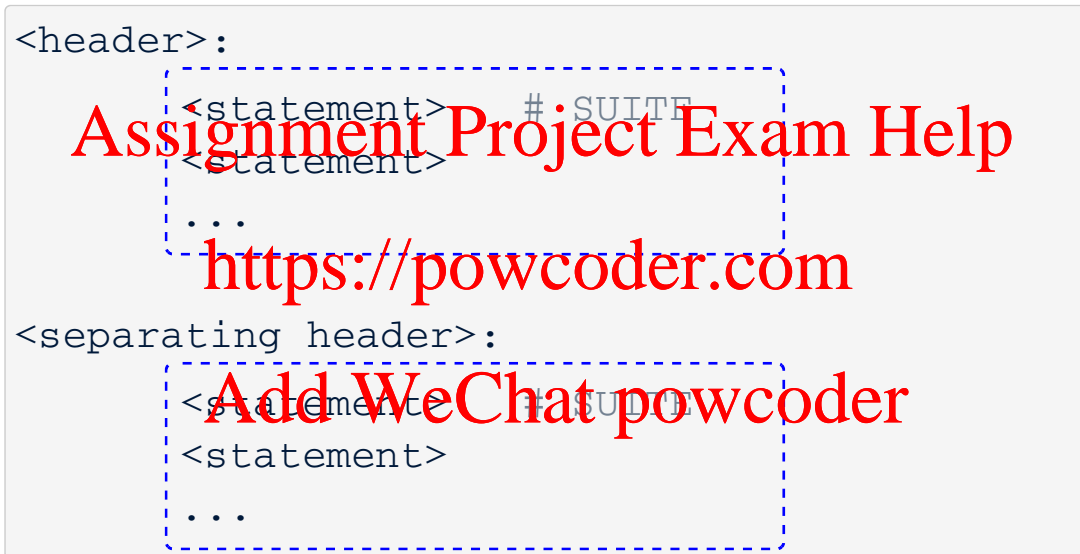

Add WeChat powcoder

Execution rule for a sequence of statements:

- Execute the first statement
- Unless directed otherwise, execute the rest

# Execution of suites

A **suite** is a sequence of statements.

Execution rule for a sequence of statements:

- Execute the first statement
- Unless directed otherwise, execute the rest

# Conditional statements

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

# Conditional statements

A **conditional statement** gives your code a way to execute a different suite of code statements based on whether certain conditions are true or false.

```
if <condition>:  
    <statement>  
    <statement>  
    ...
```

Assignment Project Exam Help

<https://powcoder.com>

A simple conditional: Add WeChat powcoder

```
clothing = "shirt"  
  
if temperature < 32:  
    clothing = "jacket"
```

# Compound conditionals

A conditional can include any number of `elif` statements to check other conditions.

```
if <condition>:  
    <statement>  
    ...  
elif <condition>:  
    <statement>  
    ...  
elif <condition>:  
    <statement>  
    ...
```

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

```
clothing = "shirt"  
  
if temperature < 0:  
    clothing = "snowsuit"  
elif temperature < 32:  
    clothing = "jacket"
```

# The else statement

A conditional can include an `else` to specify code to execute if no previous conditions are true.

```
if <condition>:  
    <statement>  
    ...  
elif <condition>:  
    <statement>  
    ...  
else <condition>:  
    <statement>  
    ...
```

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

```
if temperature < 0:  
    clothing = "snowsuit"  
elif temperature < 32:  
    clothing = "jacket"  
else:  
    clothing = "shirt"
```

# Conditional statements summary

```
if num < 0:
    sign = "negative"
elif num > 0:
    sign = "positive"
else:
    sign = "neutral"
```

Assignment Project Exam Help

Syntax tips:

- Always start with `if` clause.
- Zero or more `elif` clauses.
- Zero or one `else` clause, always at the end.

<https://powcoder.com>

Add WeChat powcoder

# Execution of conditional statements

Each clause is considered in order.

- Evaluate the header's expression.
- If it's true, execute the suite of statements underneath and skip the remaining clauses.
- Otherwise, continue to the next clause.

Assignment Project Exam Help

<https://powcoder.com>

```
1 num = 5
2
3 if num < 0:
4     sign = "negative"
5 elif num > 0:
6     sign = "positive"
7 else:
8     sign = "neutral"
```

Global frame  
num 5  
sign "positive"

# Conditionals in functions

It's common for a conditional to be based on the value of the parameters to a function.

```
def get_number_sign(num):  
    if num < 0:  
        sign = "negative"  
    elif num > 0:  
        sign = "positive"  
    else:  
        sign = "neutral"  
    return sign
```

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

```
get_number_sign(50)    # "positive"  
get_number_sign(-1)   # "negative"  
get_number_sign(0)    # "neutral"
```

# Returns inside conditionals

A branch of a conditional can end in a return, which exits the function entirely.

```
def get_number_sign(num):  
    if num < 0:  
        return "negative"  
    elif num > 0:  
        return "positive"  
    else:  
        return "neutral"
```

Assignment Project Exam Help

# While loops

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

# While loops

The while loop syntax:

```
while <condition>:  
    <statement>  
    <statement>
```

Assignment Project Exam Help

As long as the condition is true, the statements below it are executed.

<https://powcoder.com>

```
multiplier = 1  
while multiplier <= 5:  
    print(9 * multiplier)  
    multiplier += 1
```

Add WeChat powcoder

The code is significantly shorter, and it can easily be extended to loop for more or less iterations.

# Using a counter variable

It's common to use a **counter variable** whose job is keeping track of the number of iterations.

```
total = 0
counter = 0
while counter < 5:
    total += pow(2, 1)
    counter += 1
```

Assignment Project Exam Help

<https://powcoder.com>

The counter variable may also be involved in the loop computation:

```
total = 0
counter = 0
while counter < 5:
    total += pow(2, counter)
    counter += 1
```

Add WeChat powcoder

# Beware infinite loops

Uh oh..

```
counter = 1
while counter < 5:
    total += pow(2, counter)
```

# Example: Prime factors

A **prime number** is an integer greater than 1 whose only factors are 1 and the number itself (e.g., 3, 5, 7, 11).

```
def is_prime(n):  
    """Return True iff N is prime"""  
    return n > 1 and smallest_factor(n) == n  
  
def smallest_factor(n):  
    """Returns the smallest value k>1 that evenly divides N."""  
    ???  
  
def print_factors(n):  
    """Print the prime factors of N."""  
    ???
```

Let's implement them together.
