https://powcoder.com

Recursive Functions

Definition: A function is called recursive if the body of that function calls itself, either directly or indirectly

Implication: Executing the body of a recursive function may require applying that function

Assignment Project Exam Help

Drawing Hands, by M. C. Escher (lithograph, 1948)

Digit Sums

2+0+1+9 = 12

- •If a number a is divisible by 9, then sum digits(a) is also divisible by 9 •Useful for typo detection! Assignment Project Exam Help

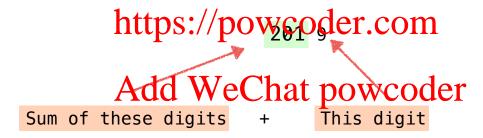

•Credit cards actually use the Luhn algorithm, which we'll implement after sum_digits

The Problem Within the Problem

The sum of the digits of 6 is 6.

Likewise for any one-digit (non-negative) number (i.e., < 10).

The sum of the digits of 2019 is Assignment Project Exam Help

That is, we can break the problem of summing the digits of 2019 into a smaller instance of the same problem, plus some extra stuff.

We call this recursion

Sum Digits Without a While Statement

7

The Anatomy of a Recursive Function

(Demo)

Recursion in Fow coder: Comprams

Recursion in Environment Diagrams

```
(Demo)
      def fact(n):
                                         Global frame
                                                                    > func fact(n) [parent=Global]
          if n == 0:
                                                        fact
               return 1
          else:
                        ssignment Project Exam Help
                           https://powcc
      fact(3)
•The same function fact is called WeChat powcod
multiple times
                                         f3: fact [parent=Global]
•Different frames keep track of the
different arguments in each call
•What n evaluates to depends upon
                                         f4: fact [parent=Global]
the current environment

    Each call to fact solves a simpler

problem than the last: smaller n
```

Iteration vs Recursion

Iteration is a special case of recursion

$$4! = 4 \cdot 3 \cdot 2 \cdot 1 = 24$$

Using while Assignment Project Examinately Pro

Math:

$$n! = \prod_{k=1}^{n} k$$

$$n! = \begin{cases} 1 & \text{if } n = 0\\ n \cdot (n-1)! & \text{otherwise} \end{cases}$$

Names:

n, total, k, fact_iter

n, fact

Verifying/Recursive Functions

The Recursive Leap of Faith

- 3. Assume that fact(n-1) is correct
- 4. Verify that fact(n) is correct

https://powcoder.com

The Luhn Algorithm

Used to verify credit card numbers

From Wikipedia: http://en.wikipedia.org/wiki/Luhn_algorithm

- First: From the rightmost digit, which is the check digit, moving left, double the value of every second digit; if product of this doubling operation is greater than 9 (e.g., 7 * 2 = 14), then sum the digits of the products (e.g., 10: 1 + 0 = 1, 14: 1 + 4 = 5)
- Second: Take the sum of all https://powcoder.com

Add WeChat powcoder						
1	3	8	7	4	3	
2	3	1+6=7	7	8	3	= 30

The Luhn sum of a valid credit card number is a multiple of 10

(Demo)

https://powcoder.com

Converting Recursion to Iteration

Can be tricky: Iteration is a special case of recursion.

```
Idea: Figure out what state must be maintained by the iterative function.
                       Assignment Project Exam Help
 def sum digits(n):
     """Return the sum of the digits of positive integer n.""" nttps://powcoder.com
     if n < 10:
                             Add WeChat powcoder
         return n
     else:
         all but last, last = split(n)
         return sum_digits(all_but_last) + last
                                                 A partial sum
                      What's left to sum
                                                                                 (Demo)
```

Converting Iteration to Recursion

```
More formulaic: Iteration is a special case of recursion.
Idea: The state of an iteration can be passed as arguments.
  def sum_digits_iter(nAssignment Project Exam Help
       digit sum = 0
      while n > 0:
           n, last = split(n) <a href="https://powcoder.com">https://powcoder.com</a>
digit_sum = digit_sum + last Updates via assignment become...
       return digit sum
                                Add WeChat powcoder
  def sum_digits_rec(n, digit_sum):
       if n == 0:
                                        ...arguments to a recursive call
           return digit sum
       else:
           n, last = split(n)
           return sum digits rec(n, digit sum + last)
```
